

10-28-2018

This letter is a brief review of my experience using the photoluminescence, PL2020 (Ultraviolet Blood Irradiation) device. I have been using it for over 3 years and on hundreds of patients. It has become a very useful and integral tool in my practice. I was very hesitant at first to try it on my patients as "the word" from 20 years of seeing patients is that "it didn't do anything", etc...I, however, had a very persistent couple who begged me to do it for them so they did not have to travel 6 hours each way. Finally, I conceded to try it. These two patients had leukemia and Prostate Cancer. I am happy to report both are doing well three years later without evidence of disease. However, it must be noted that they were very strict with diet and the protocol given to them by their cancer doctor. I do not have the facilities to properly treat cancer at my office so I refer them out for full care while offering the PL2020 as an adjunct therapy.

I perform approximately 20-30 procedures per week. My particular area of practice is with Chronic Fatigue and Fibromyalgia. As a result of working on that set of symptoms, I uncover all sorts of underlying etiologies that are affecting patients. I find thyroid dysfunction, vitamin deficiencies, Autoimmune illnesses, food allergies and infections such as Lyme, Epstein Barr, Cytomegalovirus, latent Strep, etc... In addition, I occasionally have patients with various Cancers. Sometimes, folks are just tired due to stress and poor undefined mitochondrial weakness.

Here is what I have found. First let me state the diet and exercise are key components that must be addressed when dealing with chronic illness. Those who do watch their diet and exercise, get the best results. I have come to discover that with regards to autoimmune issues and Cancer, lifestyle change is not optional. It appears to do nothing in those cases where the patient did not make any lifestyle changes.

Photoluminescence is superb at addressing any infection and now has allowed me to get my Lyme patients significant relief. It also is very effective in helping people recover energy who are just tired without any diagnosis forthcoming regardless of lifestyle changes. It is not very effective for autoimmune illness from what I have seen. In addition, performance for cancer has also shown it not to be a "stand alone" treatment.

My other incidental findings are that the PL2020 has a very profound effect on lowering blood pressure, improving COPD, and in two cases, improving ejection fraction with regard to Congestive Heart Failure. One case in particular stands out. It was a young 26 year old, man with severe Bronchiectasis with persistent abnormal chest films. He had to carry a cup around to capture his copious sputum. He was on three inhalers and frequent antibiotics and steroids. After six UBI sessions, he began to dramatically improve. He has now been doing UBI for about two years. He is back to work full time, off inhalers and is CXR last month was clear. There are several more "miracle" cases such as this. There are also people who have not benefited at all from up to 20 procedures. This is an area that needs more study.

In summary, photoluminescence is a very powerful tool in handling illness that standard medicine treats with pharmaceuticals and is completely safe and effective. I have had no complications other than occasional venous access issues in over 500 procedures to date. It seems to benefit the majority of patients regardless of diagnosis. However, several conditions also require lifestyle changes to assure maximum outcome. The procedure, indications and limitations all need further study.

Sincerely,

Geoffrey Bouc MD

April 16, 2023

To: Doctors, Clinics and Medical Directors,

This letter is to give you a little background on myself and my experience with the PL2020 device. I came into using Ultraviolet light reluctantly and through the persistence of an elderly couple that was traveling to Michigan once a week for treatment of cancer. They espoused the wonder of UBI and asked me to do it at my clinic. The connection was that their granddaughter and my daughter played on the same high school sports teams. For 2 years they were relentless in tracking me down at events to push me to do the UBI even when their visits to MI dropped to every couple of months. They stated they were cured of the cancer but were told that the 2-3 month interval was good prophylaxis.

I again congratulated them on the success, but I personally was not interested in it as I treated mostly Lyme and CFS/FMS patients. In my experience with the standard UBI did nothing for Lyme. I based this opinion on the fact that there are 2 practitioners in my area that use the old Ultra Violet extensively and I had a bad opinion of it as I saw no benefit when these patients eventually came to me! The nice elderly couple told me the old saw "this one is different", etc... I still politely declined to investigate.

In any event, I finally caved in and agreed to speak with the representative of the (PL2020) after relentless hounding and I'm glad I did.

The current iteration of the PL2020 uses calibrated UV light with two frequencies. This is all the difference in the world. I routinely get 70-80% symptoms improvement for my Lyme patients within 8 weeks of starting the Protocol. This also works for any co infection including EBV. There are really no side effect, herx reaction and I can treat Lyme successfully without the use of antibiotics long term.

Feel free to contact me directly,

Geoffrey T. Bouc MD
